**DATE(S) ISSUED:**

11/08/2016

**SUBJECT:**

Multiple Vulnerabilities in Microsoft Office Could Allow for Remote Code Execution (MS16-133)

**OVERVIEW:**

Multiple vulnerabilities have been discovered in Microsoft Office, the most severe of which could result in remote code execution if the user opens a specially crafted Microsoft Office file. Successful exploitation of these vulnerabilities could result in an attacker gaining the same privileges as the logged on user. Depending on the privileges associated with the user, an attacker could then install programs; view, change, or delete data; or create new accounts with full user rights. Users whose accounts are configured to have fewer user rights on the system could be less impacted than those who operate with administrative user rights.

**THREAT INTELLIGENCE:**

There are no reports of these vulnerabilities being exploited in the wild.

**SYSTEMS AFFECTED:**

- Microsoft Office 2007, 2010, 2013, 2013 RT, 2016
- Microsoft Office for Mac 2011, Office 2016 for Mac
- Microsoft Office Compatibility Pack SP3
- Microsoft Excel Viewer
- Microsoft PowerPoint Viewer
- Microsoft Word Viewer
- Microsoft SharePoint Server 2010, 2013
- Microsoft Office Web Apps 2010, 2013

**RISK:**

**Government:**

- Large and medium government entities: **High**
- Small government: **Medium**

**Businesses:**

- Large and medium business entities: **High**
- Small business entities: **Medium**

**Home users: Low**

**TECHNICAL SUMMARY:**

Multiple vulnerabilities have been discovered in Microsoft Office, the most severe of which could allow for remote code execution if a user opens a specially crafted Microsoft Office file.

- Ten memory corruption vulnerabilities exist when Microsoft Office fails to properly handle objects in memory. (CVE-2016-7213, CVE-2016-7228, CVE-2016-7229, CVE-2016-7230, CVE-2016-7231, CVE-2016-7232, CVE-2016-7234, CVE-2016-7235, CVE-2016-7236, CVE-2016-7245)
- A denial of service vulnerability exists when a user opens a specially crafted file. (CVE-2016-7244)
- An information disclosure vulnerability exists when Office or Word reads out of bound memory. (CVE-2016-7233)

Successful exploitation of these vulnerabilities could result in an attacker gaining the same privileges as the logged on user. Depending on the privileges associated with the user, an attacker could then install programs; view, change, or delete data; or create new accounts with full user rights. Users whose accounts are configured to have fewer user rights on the system could be less impacted than those who operate with administrative user rights.

#### **RECOMMENDATIONS:**

The following actions should be taken:

- Apply appropriate patches provided by Microsoft to vulnerable systems immediately after appropriate testing.
- Run all software as a non-privileged user (one without administrative privileges) to diminish the effects of a successful attack.
- Remind users not to visit websites or follow links provided by unknown or untrusted sources.
- Inform and educate users regarding the threats posed by hypertext links contained in emails or attachments especially from untrusted sources.
- Apply the Principle of Least Privilege to all systems and services.
